An expertly written, illustrated new analysis of the Desert Storm air campaign fought against Saddam Hussein's Iraq, which shattered the world's fourth-largest army and sixth-largest air force in just 39 days, and revolutionized the world's ideas about modern air power. Operation Desert Storm took just over six weeks to destroy Saddam Hussein's war machine: a 39-day air campaign followed by a four-day ground assault. It shattered what had been the world's fourth-largest army and sixth-largest air force, and overturned conventional military assumptions about the effectiveness and value of air power. In this book, Richard P. Hallion, one of the world's foremost experts on air warfare, explains why Desert Storm was a revolutionary victory, a war won with no single climatic battle. Instead, victory came thanks largely to a rigorously planned air campaign. It began with an opening night that smashed Iraq's advanced air defense system, and allowed systematic follow-on strikes to savage its military infrastructure and field capabilities. When the Coalition tanks finally rolled into Iraq, it was less an assault than an occupation. The rapid victory in Desert Storm, which surprised many observers, led to widespread military reform as the world saw the new capabilities of precision air power, and it ushered in today's era of high-tech air warfare. The events of World War 2 proved beyond any doubt that the strategic bombing campaign greatly contributed to the Allies' ultimate victory over Nazi Germany. British night bombing raids and daylight carpet bombing missions flown by the USAAF crews rained destruction on German cities killing thousands of civilians in the process. Amidst this massive loss of civilian life the destruction of German industrial targets seemed almost like a side note. The arms race that kicked off even before the war began produced military aircraft capable of reaching ever higher operational ceilings. At first

thin air at high altitudes was the domain of reconnaissance machines, but before long fighter and bomber aircraft began to venture there as well. In those early days high-altitude flight was a challenging business: it required the use of pressurized cockpits and boosted powerplants capable of delivering adequate power at altitude.
